

Traditional AMMs**Trading risk**

Static fee tiers expose liquidity providers to adverse selection and inventory risk while imposing inefficient trading costs on traders.

Pool flexibility

Swap algorithm, fee structure, and accounting rules are fixed at deployment.

Execution efficiency

Fragmented liquidity prevents order aggregation, increasing price impact.

Liquidity management

Stale pool prices allow arbitrageurs to extract value from passive liquidity providers.

Dynamic fees

Adapts to changing market conditions

Hooks

External smart contract for pool customization.

Intent-based protocols

Auction-based execution via batch/dutch auction

Proprietary AMMs

Active on-chain price quoting using off-chain price feeds.
